Waseet — Integrations Guide

Oct 20, 2026 · @Osama Riyad

How Waseet talks to the outside world: PayPal (the money rails) and AI (the decision engine), both behind mockable gateway interfaces, plus optional sponsor integrations for extra prize lanes. This complements the backend prompt — it is the detail behind the PayPalGateway and AIGateway interfaces.

Integration principles & gateway interfaces

Every external dependency sits behind an interface, so services depend on the contract, not the vendor SDK, and tests run without the network. Credentials come from environment variables only. Every external call has a timeout, raises a typed error, and logs in a structured way that never includes secrets or full payloads. Money-moving calls are idempotent.

Two gateways:

Interface	Methods	Implemented by
PayPalGateway	get_access_token, create_order, capture_order, create_payout, refund_capture, verify_webhook	integrations/paypal/client.py (httpx)
AIGateway	draft_criteria, verify_deliverable, mediate_dispute	integrations/ai/client.py (LLM SDK)

Services call these interfaces; the state machine decides the resulting state; the audit log records it — all in one transaction. The AI never moves money: it only decides, and the backend executes the money movement.
